## Executive Summary

Land conservation has the potential to provide returns to communities by generating benefits with an economic value that outweighs the direct or perceived costs of conservation. There are many categories of value that directly benefit residents, local businesses, and the municipality.

Land conservation improves quality of life for residents by:

- Allowing for and encouraging recreational use. Local recreational access is important because most recreational activities are conducted within five miles of home.
- Providing numerous health benefits. Research indicates that people with access to the outdoors show long term health improvement.
- Improving air quality, helping to avoid the costs associated with pollution (e.g., medical expense and lost work because of asthma attacks).
- Keeping temperatures cooler in the summer and warmer in the winter, avoiding a range of health problems and reducing energy bills.
- Helping to address disparities in access to nearby open space.

Land conservation generates local jobs and bolsters businesses by:

- Supporting tourism-related businesses.
- Recruiting new residents who may be business owners, entrepreneurs, or workers, supporting growth in earnings per job across a community.
- Protecting working landscapes and improving water quality and habitat that are vital to the farming, forestry, and commercial fishing industries.

Land conservation benefits municipalities by:

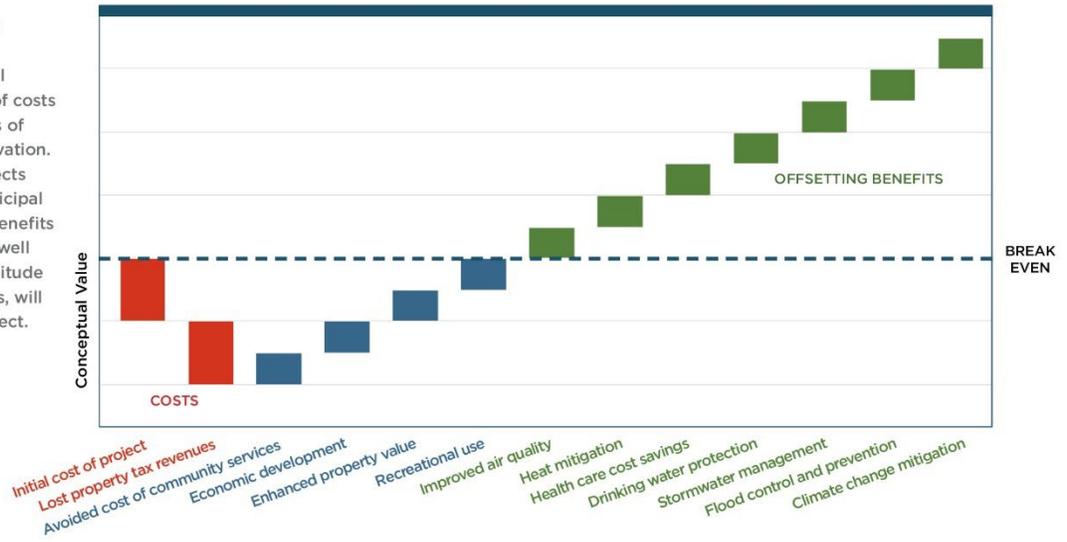

- Avoiding increased costs of public services that would have been required if the conserved property had been developed, such as increased school, public works, and public safety services.
- Positively impacting local employment outcomes and economic growth thereby improving the commercial tax base.
- Enhancing nearby property values by creating an amenity value, increasing tax revenue collected as assessments are adjusted.
- Protecting clean drinking water from contamination, filtering and cleaning drinking water, and enhancing infiltration and replenishment of groundwater resources, reducing treatment costs.
- Naturally infiltrating and managing stormwater, lowering the levels of phosphorus, nitrogen, and total suspended solids that end up in waterbodies, and thereby lowering management costs.
- Storing and slowing runoff from storms, thereby reducing the frequency and magnitude of floods. Conserving land in floodplains helps avoid property damage and infrastructure losses by preventing development in flood-prone areas where property damage is most likely during flood events.

The specific benefits and costs of conserving a parcel of land will depend on characteristics of the land and community in question. A municipal investment is sometimes requested to acquire a specific parcel of conservation land. Sometimes conserving a piece of land will remove it from property tax rolls, but in

the case of a conservation restriction or agricultural preservation restriction over land that remains in private hands, the property will still be subject to property taxation.

## Economic impact of a land conservation project

This graphic represents the potential categories of costs and benefits of land conservation. Not all projects involve municipal costs. The benefits realized, as well as the magnitude of the values, will vary by project.

## Land Conservation Benefits Residents

Land conservation improves quality of life for residents. Employees in today's economy consider more than salary when choosing where to work and reside. For example, focus groups conducted by Carnegie Mellon University have found that young creative workers, particularly those in high-technology fields, consider lifestyle factors, such as environmental and recreational quality, more heavily than the job itself when choosing where to live.<sup>1</sup> Additional research on local economic development has focused on quality of life and concerns about the natural, social, and cultural environment as well as on lifestyle affordability. Conserved land contributes to local economic development by making communities more attractive to new residents while also providing low-cost opportunities for recreation and improving health, including reducing air pollution and moderating temperature for all residents.<sup>2</sup>

### Enabling recreation

Conserved lands with public access allow for and encourage recreational use by residents. The most recent State Comprehensive Outdoor Recreation Plan (SCORP) provides helpful context about the recreational use and needs of residents, highlights of which are included here.<sup>3</sup>

- Local recreational access is important because most recreational activities are conducted within five miles of home.<sup>4</sup>
- Recreation at municipal facilities is popular (e.g., beaches, hiking trails, and nature preserves). Four out of five residents visit either state or local facilities at least a few times a year, with 41 percent visiting state lands at least monthly and 32 percent visiting municipal facilities weekly.
- Top activities include running, jogging, or walking; hiking; swimming in freshwater or saltwater; road biking; swimming in pools; and canoeing, kayaking, rafting, or tubing.
- The most popular outdoor activities for youth are team activities, such as soccer. Most common outdoor youth activities were running, jogging, or walking; swimming (any type); and road biking.
- Top requests for municipal improvements include:
  - Water-based recreation (59 percent)
  - Neighborhood park-type amenities (52 percent)
  - Trails (48 percent)

Hunting and fishing are traditional outdoor recreation activities and remain important in the state. In 2021, there were over 55,000 hunting and 169,000 freshwater fishing license holders, predominantly Massachusetts residents.<sup>5</sup> The majority of Massachusetts game species rely on a landscape dominated by forests of diverse structure and age classes.<sup>6</sup> Fisheries also depend on forests to filter runoff for clean

water and provide critical shade to cold headwater streams required by species like the iconic brook trout.

People are willing to pay for recreational access to trails, parks, and even private facilities. Users derive value even if they do not have to pay to access these amenities (e.g., pay an entry fee). The benefit accrues to the user in one of two ways: by providing cost savings to individuals who were willing to pay to recreate but did not have to, or by providing travel cost savings to individuals who do not have to travel to access a substitute site. Following the U.S. Army Corps of Engineers’ Unit Day Value methodology, it is possible to estimate recreation benefits by specific activity, assigning each activity a dollar value. Oregon State University’s Recreation Use Values Database contains values for more than 20 activities and is based on over 420 economic studies that estimated the use value of recreation activities in the United States and Canada from 1958 to 2015.<sup>7</sup>

<b>Illustration of the Range in Values for Recreational Activities in Massachusetts</b>	
<b>Activity</b>	<b>Value per Person per Day (2016\$)</b>
Backpacking	\$23
Camping	\$25
Freshwater Fishing	\$16-87
Hiking	\$91
Hunting	\$11-244
Picnicking	\$41
Sightseeing	\$36
Wildlife Viewing	\$8-98
General Recreation	\$10-57
Recreational Shellfishing	\$53
Snowmobiling	\$35

### Providing health care cost savings

Conserved lands provide numerous health benefits. Research indicates that people with access to the outdoors show long term health improvement. For example,

- Nature reduces symptoms of attention-deficit disorder<sup>8</sup> and post-traumatic stress disorder,<sup>9</sup> and improves mental health.<sup>10</sup>

<sup>7</sup> Oregon State University, Recreation Use Values Database, accessed January 13, 2022, <http://recvaluation.forestry.oregonstate.edu/database>.

How Might Contact with Nature Promote Human Health? Promising Mechanisms and a Possible Central Pathway. *Frontiers in Psychology* 6 2015: 1–8;

- Spending just 20 minutes connecting with nature can help lower stress hormone levels.<sup>11</sup>
- Access to parks and recreational resources can reduce child obesity.<sup>12</sup>
- Proximity to more green space is associated with reduced mortality and increased longevity.<sup>13</sup> For example, women living with a higher amount of greenness around their homes had a 12 percent lower rate of death from non-accidental causes compared to women living with the least amount of greenness. Another study found a reduced COVID-19 mortality rate with higher greenspace access.<sup>14</sup>

Recreational use by residents improves health and reduces health care spending. The Centers for Disease Control and Prevention (CDC) recognizes that physical activity helps improve overall health and reduces the risk for chronic diseases. As such, the CDC promotes physical activity guidelines, defining sufficient activity as at least 150 minutes of moderate-intensity activity per week or at least 75 minutes of vigorous-intensity activity per week, along with muscle-strengthening activities at least two days per week.<sup>15</sup> The recent SCORP survey found that people who run, jog, or walk do that activity much more frequently than other activities' participants. Forty percent of them run, walk, or jog multiple times per week.<sup>16</sup> Local publicly accessible open space can provide residents with the opportunity to engage in active recreation that improves their health and reduces health care spending.

### Improving air quality

Air pollution is a significant and expensive problem that injures human health and damages structures. Human cardiovascular and respiratory systems are affected, with broad consequences for health care costs and productivity.<sup>17</sup> In addition, acid rain, smog, and ozone increase the need to clean and repair buildings and other infrastructure.<sup>18</sup> The vegetation in conserved lands plays a role in improving air quality, helping nearby areas avoid the costs associated with pollution.<sup>19</sup> Trees and shrubs have the

ability to remove pollutants from the air. Leaves absorb gases such as nitrogen dioxide, sulfur dioxide, carbon monoxide, and ozone. As it adheres to plant surfaces, particulate matter (PM), which includes small particles of dust, metals, chemicals, and acids, can also be removed. Breathing air pollutants, including fine particles and ozone, can lead to premature death, nonfatal heart attacks, aggravated asthma, and lost days of work and school.<sup>20</sup>

### Carbon storage and sequestration

Massachusetts forests accumulate and store carbon, removing carbon dioxide emissions from the atmosphere.<sup>21</sup> In New England, forests offset more than 20 percent of the region's carbon dioxide emissions. In addition, New England's forests remove over 760,000 tons of air pollution each year, which is worth an estimated \$550 million in health benefits.<sup>22</sup> When forests are permanently cleared for development, they lose this ability to sequester and store carbon.

The U.S. Forest Service's i-Tree tool estimates the air pollution removal benefits for Massachusetts' counties based on the tree cover data for the year 2010. Air pollution removal values ranged from \$53,000 in Nantucket County to \$66.9 million in Middlesex County. See Appendix A for the complete list of values for Massachusetts counties.

### Naturally moderating temperature

Studies have shown that trees around residences keep homes cooler in the summer and warmer in the winter which reduces cooling and heating costs and improves human health and comfort.<sup>23</sup> The phenomenon of urban areas experiencing elevated temperatures relative to surrounding non-urbanized areas due to alteration of natural land-cover is known as the Urban Heat Island (UHI). Less attention has been given to temperature elevations in low density residential areas, but trees significantly reduce temperatures even in low-density residential areas.

Trees are an effective means of offsetting the energy-intensive urban heat island effect. Worcester's urban forest has been greatly degraded by large climatological, biological, and anthropogenic disturbance events, including a recent Asian Longhorned Beetle infestation. To exterminate the Asian Longhorned Beetle, from 2008 to 2010 30,000 mature trees were removed decreasing urban tree cover by 21 percent. The loss in urban tree canopy increased peak temperatures by an additional 1 to 6 degrees Celsius and extended the summer warm period by up to 15 days. This leads to increased energy bills for home cooling. To give a sense of the order of magnitude of these costs, as of 2008 Worcester had 17,113 street trees providing nearly \$1 million in energy savings benefits.<sup>24</sup>

Extreme heat also causes a range of health problems including heat exhaustion, heat stroke, even death. In New England, an estimated 2,302 deaths are attributable to heat annually.<sup>25</sup> Many of these premature deaths are preventable by simply increasing tree canopy cover.<sup>26</sup> This is especially important for households that lack access to air conditioning.

### Supporting environmental justice

Additional local land conservation is necessary to address current disparities in access to nearby open space. Studies have shown significant disparities in access to open space. Lower income neighborhoods generally have less greenspace and trees; fewer, smaller, more crowded, and warmer parks; and more summer heat.<sup>27</sup> Participation in outdoor recreation is also lower for reasons including institutional discrimination and structural inequality in leisure time and access to transportation, as well as personal experiences of racism, limited access points, or congestion of park spaces.<sup>28</sup>

A recent study of New England found substantial disparities in the percentage of nearby protected land for more vs. less socially marginalized communities. Households in census tracts within the lowest income quartile have just half as much nearby protected land as those in the highest income quartile and communities with the highest proportions of people of color have less than 60 percent as much protected land as those with the lowest proportions.<sup>29</sup> They found that disparities by income persist within urban, exurban, and rural census tracts and within all states in the region. Lack of access to transportation can exacerbate access challenges, and emphasize the importance of local protected open space.

Improving environmental justice also requires attention to the processes of priority setting and decision-making within municipalities to ensure inclusion of all stakeholders and balancing of multiple

priorities.<sup>30</sup> Future land protection efforts can satisfy multiple community priorities. The study found that prioritization based on clean drinking water also had positive potential to decrease racial or income disparities in land protection. The Incorporating Environmental Justice Criteria in Land Conservation map created by researchers at Amherst College, Harvard Forest, and StarLuna Consulting shows census tracts in New England with a high degree of social marginalization and low amount of open space.<sup>31</sup> Environmental justice areas have both high social marginalization and little land protection.

### Land conservation builds partnerships and cultivates equity Northampton

In 2017, the City of Northampton, acquired 54 acres of working farmland, wetlands, and forest that abutted the Fitzgerald Lake Conservation Area. The project also included 4 acres of adjacent farmland located just across the municipal line in the Town of Hatfield. Kestrel Land Trust partnered with Northampton to acquire the 4 acres in Hatfield in order to keep the farm whole and to manage the farmland on the Northampton side. The primary source of funding was Community Preservation Act funds.

The approximately 46 acres of important wetlands and recreational land were added to the Fitzgerald Lake Conservation Area while the remaining 9.5 acres were leased to the Pioneer Valley Workers' Center. The Pioneer Valley Workers' Center established La Colmena Community Farm which consists of the Riquezas del Campo Farm Coop, an independent majority immigrant-led LLC, and La Colmena Community Garden.<sup>32</sup> The Coop grows herbs and vegetables, which are sold locally (within 25 miles) to wholesale buyers, and to individual customers at farmers markets, where they feature traditional ingredients from a variety of cultures like cilantro, tomatillos, collard greens, and a wide variety of peppers, and where they accept SNAP/HIP. The half-acre community garden provides members with access to small plots of land to grow food for their families, as well as gather to cultivate community and share knowledge through a variety of workshops. Pioneer Valley Workers' Center has also made portions of the field available to other farmers until Riquezas del Campo grows into full use of the field, including through All Farmers, a local organization supporting refugee and immigrant farmers.

## Conservation Land Benefits Local Businesses

Land conservation contributes to local economies in terms of jobs, business growth, taxes, and other revenue. Outdoor recreation drives many economic benefits, including support for tourism-related businesses and recruiting new residents who may be business owners, entrepreneurs, or workers, supporting growth in earnings per job across a community.<sup>33</sup> Protecting working landscapes and improving fish habitat and water quality contribute to the farming, forestry, and commercial fishing industries. Together these industries employ hundreds of thousands of workers and generate billions in value add in communities across the state.<sup>34</sup>

### Tourism and outdoor recreation economy

Land conservation supports a thriving tourism and outdoor recreation economy. The outdoor recreation tourism economy includes spending by visitors.<sup>35</sup> Travelers to conserved lands with public access, such as parks and trails, spend money locally supporting local income and jobs. In fiscal year 2020, 7.1 percent of domestic visitors came to Massachusetts with the primary trip purpose of outdoor recreation.<sup>36</sup> They spent \$1.48 billion resulting in \$37.9 million in local tax receipts. Suffolk County had the highest domestic visitors' expenditures at \$730 million, while Middlesex County had the most jobs with 1,700. See Appendix B for a breakout of tourism spending impacts by county. Many visitors who come to Massachusetts for educational or cultural events, from the Berkshires to the Cape and Islands, are also attracted by the landscapes and open space recreational opportunities.<sup>37</sup>

The overall outdoor recreation economy includes spending by both residents and visitors. According to the Bureau of Economic Analysis outdoor recreation accounted for \$7.69 billion in value added, representing 1.3 percent of the Commonwealth's GDP, and 90,600 jobs.

---

<sup>33</sup> Headwaters Economics. 2019. Recreation Counties Attracting New Residents and Higher Incomes: Recreation, especially in non-metro places, draws residents, higher incomes, and faster earnings growth than places without recreation. January 2019. Accessed February 1, 2022 <https://headwaterseconomics.org/wp-content/uploads/recreation-counties-attract-report.pdf>.

<sup>34</sup> Value-added (also known as gross regional product, or GRP) is the sum of labor income, other property income (e.g., rents and profits) and indirect business taxes (e.g., excise and sales taxes). It is the difference between an industry's total output and the cost of its intermediate inputs.

<sup>35</sup> Outdoor recreation spans many activities, from traditional activities like hunting, fishing, camping, and hiking to more casual outdoor activities like gardening and outdoor festivals. BEA defines outdoor recreation to include all recreational activities undertaken for pleasure that generally involve some level of intentional physical exertion and occur in nature-based environments outdoors. A visitor is defined as someone who travels at least 50 miles one way or stays overnight in paid accommodations.

<sup>36</sup> Massachusetts Office of Travel & Tourism. 2020 Annual Report. Published April 2021.

<sup>37</sup> While the primary purpose of outdoor recreation accounts for 7.1 percent of domestic visitation, visitors with other primary purposes (e.g., visiting friends and family 47.7 percent, or entertainment and sightseeing 14.7 percent) frequently combine outdoor recreation activities with their trip such as going to a beach (11.9 percent), rural sightseeing (10.1 percent), urban sightseeing (10.7 percent), and enjoying State and National parks (10.3 percent). Massachusetts Office of Travel & Tourism. 2020 Annual Report. Published April 2021.

## Capturing flood waters and providing recreation opportunities

### Scouting Woods Recreation Area in Peabody

Peabody Square has experienced significant flood events since the 1950s, including three floods that were declared Federal Disasters. The city studied flood mitigation alternatives for the impacted area for several years and recently began aggressively implementing several stormwater improvement projects upstream.<sup>38</sup> One of those projects was creating the 3.5 acre Scouting Way detention basin that can hold 2.8 million gallons of stormwater.<sup>39</sup>

In 2008, the city acquired Scouting Woods, 11.46 acres of land formerly owned by Eastman Gelatin Corporation, using \$550,000 in Community Preservation Act funding.<sup>40</sup> In 2013, the city constructed a stormwater detention basin and 9-hole disc golf course on the property.<sup>41</sup> The city spent \$2.2 million on the project. The alternative was a costly, \$18 million, multi-phase gray infrastructure project to install new culverts and widen the North River canal.<sup>42</sup>

In 2020, Scouting Woods was further protected with a conservation restriction held by Greenbelt, Essex County's Land Trust.<sup>43</sup>

The city is considering purchasing abutting land and developing a trail network linking Scouting Woods to Flume Pond and the Higgins Middle School, extending the recreational benefits of the project.<sup>44</sup>

## Forest products industry

The main threats to the productive capacity of Massachusetts forests are development/conversion of forest to non-forest (including forest clearing to build ground mounted solar arrays), climate change, fire and natural disasters, herbivore browsing, pests and disease, and economic factors (e.g., additional costs associated with increasing distance to pulpwood processors).<sup>45</sup> A recent study of forest loss in New England found that 'distance to nearest developed land' was the greatest predictor of forest conversion to low-density development, followed by 'distance to roads'.<sup>46</sup> In Massachusetts, population density was also an important factor in conversion to low- and high-density development. As suburbanization increases in Massachusetts, parcels at the suburban-rural interface may be most vulnerable to

<sup>46</sup> Thompson J., J. Plisinski, P. Olofsson, C. Holden, and M. Duveneck. 2017. Forest loss in New England: a projection of recent trends. PLoS One, 12(12). <https://doi.org/10.1371/journal.pone.0189636>.

conversion. Additionally, in Massachusetts, the average parcel size for nonindustrial private forestland is less than 20 acres and as parcel size decreases, so does the likelihood of timber harvesting.<sup>47</sup> Social factors for landowners, as well as minimum sizes for profitability for loggers, contribute to this trend.<sup>48</sup> Therefore, conservation of forestland can help to preserve the viability of forestry.

The forest products industry employs 16,100 workers directly, with labor income of \$1.55 billion.<sup>49</sup> For a total value added of \$1.44 billion and output of \$5.35 billion.<sup>50</sup> Multipliers capture the indirect and induced economic activity generated by the re-spending of income or sales revenues in a regional economy. When multipliers are considered, the forest products industry provides 37,800 jobs indirectly, with \$3.10 billion in labor income, \$3.81 billion in value-add, and \$9.23 billion in output.

Approximately 98 percent of the wood that Massachusetts residents use is imported, suggesting there are likely opportunities to increase the amount of sustainably managed locally harvested wood products.<sup>51</sup>

For the most up to date statistics on land use change (between 2012 and 2017) and total area of development, natural land, and open land for each of the 351 towns and cities in Massachusetts see Mass Audubon's *Losing Ground: Nature's Value in a Changing Climate*

<https://www.massaudubon.org/our-conservation-work/policy-advocacy/shaping-climate-resilient-communities/publications-community-resources/losing-ground>

## Agriculture

Across Massachusetts, farmland loss threatens food security, local economies, ecological integrity, climate resiliency, and the very fabric of communities.<sup>52</sup> According to American Farmland Trust Massachusetts is the 9<sup>th</sup> most threatened state for farmland loss in the country.<sup>53</sup> From 2001 to 2016, 6,750 acres of state significant farmland was converted to urban and highly developed land uses.<sup>54</sup> Land

<sup>54</sup> State significant agricultural land is defined as all land with a productivity, versatility, and resiliency (PVR) value above the state median. The PVR model incorporates detailed maps of soil productivity and environmental limitations, land cover/use, types of crops produced, and length of growing season, and prioritizes them according to weights elicited from a group of national experts. Land with a high PVR score is best suited for long-term cultivation and food production.

conservation has an important role to play in sustaining the agriculture industry, with 21.6 percent of agricultural land in Massachusetts currently protected.<sup>55</sup>

With 7,240 farms and 492,000 acres in farmland, agriculture is a key part of the Massachusetts landscape and economy.<sup>56</sup> The agricultural industry in the state directly employs 25,920 individuals and produces an annual market value of over \$475 million in agricultural goods.<sup>57</sup> The average Massachusetts farm produces \$65,624 worth of agricultural products on 68 acres.

Direct market sales are a key feature of Massachusetts agriculture. Massachusetts ranks 5<sup>th</sup> in the nation for direct market sales with over \$100 million and ranks 3<sup>rd</sup> in the nation for direct market sales per farm at \$55,384. Direct market sales account for 21.1 percent of the state's total sales of agricultural products -- the highest proportion in the country. Additionally, Massachusetts ranks 8<sup>th</sup> in the nation for direct sales per capita. Direct sales are critical to sustainability for farmers because the farmer can eliminate costly intermediaries, such as distributors and retailers, and capture more of the revenue for their own businesses.<sup>58</sup> Farmers are also able to set prices that reflect the cost of production, a key to ongoing viability. Direct to consumer sales ripple through the local economy. According to Community Involved in Sustaining Agriculture (CISA), "If every household in Massachusetts spent \$20 more on local food per month (and \$20 less on non-local food), \$234,768,540 more local income would be generated per year and 3,876 local jobs would be created in the State."<sup>59</sup>

Small and family orientated farm culture is prevalent in Massachusetts agriculture. However, there are differences by region. For example, as of 2017, Suffolk and Nantucket Counties tie for the smallest number of farms at 21, while the average size is one acre in Suffolk and 37 acres in Nantucket.<sup>60</sup> Worcester County has 1,568 farms, totaling 95,308 acres, with an average size of 61 acres. Key agricultural statistics by county can be found in Appendix C.

Massachusetts' large food processing industry, including agricultural production and processing, has \$4.50 billion in direct sales, generates \$7.14 billion in impact, and supports more than 36,000 jobs in Massachusetts.<sup>61</sup>

### Commercial fishing

Coastal land conservation protects fish habitat and water quality contributing to the commercial fisheries industry and closely related economic sectors. The water quality in the state's estuaries near coastal areas is directly affected by the water purification, flood control, and stormwater protection provided by natural areas. Massachusetts commercial fishing and seafood industry is the third largest in the U.S.<sup>62</sup> In 2018, it generated the largest fishing and seafood industry employment impacts in the New England region with 143,902 full- and part-time jobs. Massachusetts also generated the largest sales

impacts (\$16 billion), value-added impacts (\$6.1 billion), and income impacts (\$3.9 billion) of the fishing and seafood industry in New England.

### Preserving farming and providing recreation opportunities

#### Sweetwilliam Farm in Upton

This 250-year-old farm was owned by Eli Whitney's grandfather.<sup>63</sup> The farmhouse was built by Eli's cousin Ephraim Whitney, a revolutionary war veteran. The Whitney Family owned the farm until about 1900. This 96-acre historic farm property was protected in 2011.<sup>64</sup> The Town of Upton, working in partnership with Sudbury Valley Trustees, a regional land trust, purchased 63 acres of the farm property creating the Whitney Conservation Area, and established a conservation restriction on another 33-acres, which became Fivefork Farms. The total project cost was \$1.26 million, comprised of \$688,500 in Community Preservation Act funds, a \$500,000 LAND grant from the Massachusetts Division of Conservation Services, and \$74,000 in private funds. Preservation of Sweetwilliam Farm also provided an opportunity for a conservation buyer to preserve an additional 70 acres of adjacent forest land.

The Whitney Conservation Area is a forested area with trails linking to Upton State Forest and the Warren Brook Watershed Conservation Area, and is part of the Miscoe, Warren, Whitehall Area of Critical Environmental Concern. Warren Brook is designated a high-quality cold-water fishery.<sup>65</sup>

Fivefork Farms specializes in growing cut flowers for the farm's CSA, area farmers' markets, retail stores, florists, and designers.<sup>66</sup> The farm currently has six full-time and two part-time employees.

If the farm had not been protected up 30 homes could have been built on the property.

## Land Conservation Benefits Municipalities

Land conservation can potentially improve the municipal bottom line. Studies have shown that property tax revenue losses are often offset by other impacts of conserving the parcel, including:

- Avoiding increased costs of public services that would have been required if the conserved property had been developed, such as increased school, public works, and public safety services.
- Positively impacting local employment outcomes and economic growth thereby improving the commercial tax base.
- Enhancing nearby property values by creating an amenity value, increasing tax revenue collected as assessments are adjusted.

In addition, development of open space in Massachusetts leads to increases in impervious surface, increases in water runoff, increases in nitrogen and phosphorus loading, and lost filtration capacity.<sup>67</sup>

<sup>67</sup> Thompson, J., K. Lambert, D. Foster, E. Broadbent, M. Blumstein, A. Almeyda Zambrano, and Y. Fan. 2016. The consequences of four land-use scenarios for forest ecosystems and the services they provide. *Ecosphere* 7(10):e01469.

This often translates to increased costs for municipalities to provide clean drinking water, manage stormwater, and protect infrastructure from flooding.

A comprehensive study of land conservation in New England from 1990 to 2015, including both ownership and easement-based protection, found that land protection did not have a substantial impact on property tax rates.<sup>68</sup> That is, on average, the tax impacts of land conservation were found to be small and dissipate over time, adding just a few dollars to the annual tax bill for most homeowners. In Massachusetts, the study found that on average, new protection resulted in small property tax rate increases of \$0.58 to \$0.88 per \$100,000 of taxable property value for the average annual new area protected of 54 acres. This translates to an annual tax bill increase of \$2.10 to \$3.18 for a typical home with a tax bill of \$4,828. They found no evidence that the impacts last over time or affect municipal expenditures. However, for towns that are growing slowly, have lower household incomes, or municipal land acquisition, they study estimated greater impacts, ranging from a \$5 to \$30 tax bill increase for each \$100,000 of value.

### Avoiding costs of community services

Often, since developed land has a higher assessed value than undeveloped land, people think increased development will enable a city or town to provide better services.<sup>69</sup> This focus on assessed value is understandable with Massachusetts municipalities relying on property taxes for a majority of local revenues. (See Appendix D for a look at an average municipal budget.)<sup>70</sup> However, new development brings not only more revenue, but also more expenses, particularly for residential development. In Massachusetts, education accounts for nearly half of municipal spending, on average.<sup>71</sup> Undeveloped land is frequently beneficial to communities because it may bring in more revenue than it uses in services.

Communities across Massachusetts and the country have used cost of community services studies to analyze the ratio of tax revenues to public service expenditures for different land uses. A recent study of four towns in Massachusetts (i.e., Great Barrington, Whately, Upton, and Haverhill) showed lower expense to revenue ratios for open space and commercial land than residential land. This means, for example, that for every dollar of tax revenue collected from open space in Great Barrington, \$0.35 is spent providing services for that land, while every dollar of tax revenue collected from residential development requires \$1.12 in municipal expenses.<sup>72</sup> The ratios calculated in this study are similar to previous cost of community services research. American Farmland Trust found that across 151 communities nationwide (including 13 in Massachusetts) residential development is a net fiscal loss for communities.<sup>73</sup> That is, for every \$1 in property tax revenues it generates, residential development

---

<sup>68</sup> Kalinin, A., K. Sims, S. Meyer, and J. Thompson. Does land conservation raise property taxes? Evidence from New England cities and towns. Working Paper. January 2022. Available at: <https://sites.google.com/view/alexey-kalinin/research?authuser=0>.

<sup>69</sup> Murray, H., and C. Paul, 2019. Fiscal Impacts of Land Use in Massachusetts: Up-to date Cost of Community Services Analyses for 4 Massachusetts Communities. University of Massachusetts Amherst Extension.

<sup>71</sup> Ibid.

<sup>72</sup> A recent University of Massachusetts study of four towns found that for every dollar of revenue brought in from open space the following is spent providing services for that land: Great Barrington \$0.35; Whately \$0.46; Upton \$0.34; and Haverhill \$0.74.

<sup>73</sup> Farmland Information Center. 2016. Cost of Community Services Studies. Partnership between the U.S. Department of Agriculture Natural Resources Conservation Service and American Farmland Trust.

requires \$1.16 in services (median value), while working and open lands require \$0.37 in services. A meta-analysis of 125 cost of community services studies across the country again found that residential land uses tend to have ratios greater than one, while commercial/industrial and agricultural/open-space land uses tend to have ratios less than one.<sup>74</sup>

### Strengthening economic development

Strong local economies have a stronger tax base. Conserved lands help communities cultivate a competitive advantage by enhancing quality of life and attracting talent, employers, and investment. The availability of quality open space and recreation resources helps to attract businesses.<sup>75</sup> Many workers choose a job based on an area's quality of life, which is increased by the availability of open spaces. Furthermore, small-business decision makers rated park, recreation, and open space amenities as being the most important factor in measuring quality of life. This shows how important the investment of open space is to the future economic well-being of Massachusetts communities.

Saving land can also help local economies. A recent study of all major towns and cities in New England found that land conservation moderately increased local employment numbers and the labor force, without reducing new housing permits.<sup>76</sup> This was found to be especially true in rural areas.

### Enhancing home values

Conserved lands have a positive impact on nearby home values and associated property tax revenues.<sup>77</sup> Examples relevant to land protection in Massachusetts include:

- In Amherst, according to the American Planning Association, cluster housing with dedicated open space was found to appreciate at an annual rate of 22 percent, compared to a similar conventional subdivision's rate of 19.5 percent.<sup>78</sup>
- Vacant land that shares a border with a conserved parcel, through either fee simple or conservation easement, increases in value by 46 percent.<sup>79</sup> This benefit declines with distance, although the rate of decline is less with conservation easements. In addition, the study found separate, positive price effects from new land conservation of 3 percent for property that is within view.
- Open-space acquisitions increase home values across a municipality. An average expenditure on open space of \$162 per housing unit, was found to increase the average house price by 0.6

percent during the study period, even when controlling for other market forces.<sup>80</sup> Another national study that found positive impacts of open space expenditures on municipal home values investigated whether this increase in home price was due to the supply of developable land being more restricted due to land conservation.<sup>81</sup> It found that across 710 municipalities from 1997 to 2013, open space spending did not affect new development, as measured by annual number of new housing units permitted.

### Protecting drinking water

About 90 percent of Massachusetts residents get their water from public water supplies; the rest have private wells.<sup>82</sup> Two thirds of those who use public water supplies rely on surface reservoirs, while the remaining depend on public wells. The Quabbin and Wachusett Reservoirs serve as the full, partial, or back-up water supply for 53 communities.<sup>83</sup> Many rural communities rely on groundwater.

Forested land protects drinking water from contamination, naturally filters and cleans water, and enhances infiltration and replenishment of ground water resources. Each acre of forest near a reservoir or well filters and protects 543,000 gallons of drinking water per year, with an annual value of \$2,500, or \$60,000 present value.<sup>84</sup> This value will likely increase over time. Increasingly frequent drought conditions combined with PFAS contamination is putting public water supplies at risk.<sup>85</sup>

In the greater Boston areas, EPA has estimated that natural vegetated areas provide ground water recharge at an average rate of approximately 450,000 gallons per acre per year. It is less costly to treat drinking water from ground water sources than from surface water sources. If ground water sources are degraded or inadequate, water suppliers may have to resort to using more costly surface water alternatives. Sustainable ground water reserves may help suppliers avoid purchasing potable water during times of low yield.

### Naturally infiltrating and managing stormwater

The largest threat to Massachusetts waterways is from stormwater pollution.<sup>86</sup> Rain washes the pollution that collects on pavement into storm sewers that flow directly into rivers, ponds, and lakes. Conserved lands can reduce stormwater runoff and filter pollutants, lowering the levels of phosphorus, nitrogen, and total suspended solids that end up in waterbodies, thereby lowering management costs.<sup>87</sup> Conserved lands support water quantity as well as quality, because their pervious surfaces capture and absorb precipitation, slow runoff, infiltrate and recharge groundwater, and filter out pollutants. Meanwhile, vegetation on conserved lands provides a considerable surface area that intercepts and

<sup>83</sup> Massachusetts Water Resources Authority. How the MWRA Water System Works. Accessed February 1, 2022, <https://www.mwra.com/04water/html/watsys.htm>.

<sup>84</sup> Executive Office of Energy and Environmental Affairs. 2015. Looking to the Future – Massachusetts Land and Park Conservation and Their Future.

<sup>85</sup> Personal communication with Mark Voorhees, Environmental Engineer, Environmental Protection Agency, February 1, 2022.

<sup>86</sup> Executive Office of Energy and Environmental Affairs. 2015. Looking to the Future – Massachusetts Land and Park Conservation and Their Future.

<sup>87</sup> The Trust for Public Land. 2021. The Economic Benefits of Conserved Lands, Trails, and Parks on the North Olympic Peninsula.

stores rainwater. In effect, these green spaces function like storage reservoirs, reducing peak flows of runoff during rain events.

Land conservation is a proactive approach to avoiding stormwater management costs.<sup>88</sup> Converting natural vegetated areas in Massachusetts to impervious cover will decrease water quality by increasing phosphorus and nitrogen levels.<sup>89</sup> Decreased water quality will require implementing costly Best Management Practices (BMPs), such as infiltration trenches and enhanced biofiltration, to meet regulatory requirements. The range in potential control costs per acre of conversion to impervious cover is \$62,000 to \$79,000 for phosphorus and \$48,000 to \$58,000 for nitrogen. Therefore, protecting an acre of natural land provides stormwater management values ranging from \$48,000 to \$79,000.

The U.S. Forest Service's i-Tree tool estimates the annual hydrological benefits of avoided runoff for Massachusetts counties based on the tree and impervious cover data for the year 2010. Values range from \$140,000 in Nantucket County to \$49.1 million in Middlesex County.<sup>90</sup> See Appendix A for the complete list of annual values for Massachusetts counties.

### Preventing and controlling flooding

Flooding is the most expensive natural hazard in Massachusetts, with \$400 million in total losses from 2000 to 2019.<sup>91</sup> Forests and other natural landscapes help to store and slow runoff from storms, thereby reducing the frequency and magnitude of floods.<sup>92</sup> Conserving land in floodplains helps avoid these costs by preventing development in flood-prone areas where property damage is most likely during flood events.<sup>93</sup> Wetlands and natural areas near rivers and streams also prevent costly property damage by absorbing and storing potentially devastating floodwaters. Wetlands in Massachusetts have been estimated to prevent over \$40 million in flood damage statewide annually.<sup>94</sup> Wetlands around Boston are estimated to prevent \$42,111 of flood damage per acre.<sup>95</sup> Mass Audubon has estimated that fresh and salt water wetlands in Massachusetts provide \$2.3 billion in annual ecosystem service value.<sup>96</sup> The Army Corps of Engineers has estimated that wetlands in the Charles River Watershed prevent \$18 million in flood damage every year. Protecting these wetlands and the lands adjacent is necessary to preserve these values.

---

<sup>88</sup> Massachusetts stormwater standards mitigate but do not eliminate the impact of new development on flooding and surface water quality. Meeting these standards assumes the perpetual maintenance and repair of stormwater management infrastructure such as detention basins, culverts, pipes, catch basins, and swales. Massachusetts Stormwater Handbook and Stormwater Standards, accessed March 1, 2022 <https://www.mass.gov/guides/massachusetts-stormwater-handbook-and-stormwater-standards#-stormwater-handbook-volume-1->.

## Providing clean drinking water and recreation opportunities

### North Pond in Southwick

The lands around North Pond are a major source of water recharge for the aquifer that serves as the source of drinking water for residents of Southwick, Westfield, and West Springfield.<sup>97</sup> Deep layers of saturated material transmit large quantities of water that originate in the lakes and surrounding area then move through highly permeable sand and gravel deposits. The area in which the aquifer and aquifer recharge areas lie are seeing a significant amount of residential development and care needs to be taken to make sure that the area is not overloaded with septic systems, storm runoff, and increased flood potential which may severely damage drinking water quality.

Faced with these potential impacts the Town of Southwick, the Department of Fish and Game (DFG), and Franklin Land Trust worked together to conserve roughly 150 acres on North Pond. This land will continue naturally cleaning drinking water for thousands, while offering new recreation opportunities to the public.

Southwick owns 62 acres, with DFG holding a conservation restriction. Southwick allows public access creating many opportunities for hiking, swimming, and fishing. With 2,900 feet of pristine shoreline, it is a popular place for boating and fishing.

DFG added 83 acres to the Southwick Wildlife Management Area (WMA) in 2017.<sup>98</sup> The Southwick WMA is part of a larger effort to conserve grassland habitat in the Connecticut Valley.<sup>99</sup> DFG had acquired most of the WMA property in 2008 and has conducted extensive grassland restoration and forest management to promote healthy and vigorous growth of native grasses, shrubs, and trees. Several maintenance roads and unmarked trails wind through the WMA and can be used for walking, hiking, birding, cross-country skiing, and hunting.

The land is adjacent to conserved grasslands in Connecticut, which makes this area one of the largest areas of permanently protected grasslands in New England. Several threatened species of birds rely on these grasslands, such as the kestrel, woodcock, bobolink, grasshopper sparrow, vesper sparrow, and the upland sandpiper.

## Mitigating climate change

Climate change is expected to have important impacts to forests, farms, and habitats across the state. Intense rainstorms are likely to occur more frequently causing more flooding, especially where existing paved and developed areas increase storm flows. Summer drought conditions will strain public water supplies. Invasive plants and insects will also expand in this changing landscape. Mosquito-borne diseases may become more prevalent. New England communities, states, and businesses will need to make major investments to combat and accommodate rising temperatures and sea levels and the increased frequency of flooding and severe storms.

<sup>99</sup> Division of Fisheries and Wildlife. Lands User Guide Southwick Wildlife Management Area.

Studies have shown that municipal land use land cover decisions may have a larger impact on the magnitude of stormwater, flooding, and water quality impacts than climate change. For example, conserving and actively managing forestland, with some development, could result in less impervious area, protect water quality, and limit stormwater and flooding issues.<sup>100</sup> A study investigating both runoff and water quality, found as runoff increases, pollutants such as suspended solids, nitrogen, and phosphorus also increase.<sup>101</sup> Without land conservation costly BMPs may have to be employed to reduce runoff and treat pollutants such as nutrients and sediment through biological, chemical, and physical processes.

## Conclusion

Land conservation is vital to Massachusetts communities. Conserving land does not have a substantial impact on net property tax revenues over time, with any costs often offset over time by the benefits provided to residents, businesses, and the municipality. Land conservation improves the quality of life for a community's residents by enabling recreation, providing health benefits, improving air quality, moderating temperatures, and supporting environmental justice. Land conservation contributes to local economies by generating jobs, business growth, taxes, and other revenue. Land conservation saves municipalities money by avoided costs of community services of new development, boosting the tax base by strengthening economic development and enhancing existing home values, protecting drinking water supplies, naturally infiltrating and managing stormwater, providing flood control and prevention, and mitigating climate change impacts.
